NOTIFICATIONS

Juan Luis Gorricho

USER NOTIFICATIONS

- There are situations where it's necessary to notify the user of a new event
- Three notification types are defined:
  - Toast Notification
  - Dialog Notification
  - Status Bar Notification

NOTIFICATIONS

- **Toast Notification**: temporal “pop-up” message, no interaction is possible, it fits the size of the content, it doesn't block the current activity visibility, it can be fired from a service even if the app. is not visible.
- **Dialog Notification**: this is the pop-up dialog window used in previous exercises, the current activity losses the focus.
- **Status Bar Notification**: adds an icon on the status bar. Unfolding the status bar, the icon can be shown with an associated text; clicking on that entry, Android fires an intent previously defined by the notification, usually to start an Activity.

STATUS BAR NOTIFICATIONS

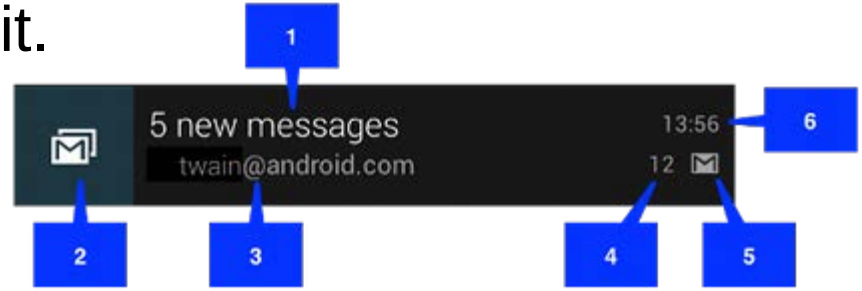

- It is recommended to use **NotificationCompat.Builder** to create a notification. Invoking at least: setSmallIcon(), setContentTitle(), setContentText().
- To add the action to start an activity from the notification we must use a **PendingIntent** object. The activity is added to the stack of activities of the app. unless a specific technique is used.
- To send the notification we use the **NotificationManager**, passing as parameters: an id and the notification itself. Different ids mean different notifications on the status bar.
- The notification can be set as auto-cancelable or can be cancelled by code (individually by ID or all of them).

STATUS BAR NOTIFICATIONS

- Two notification views are defined: normal and big. To show a big notification it has to be the first of the list or you must click on it.
- Normal View:

- Big View: Each big view style sets area #7 in a different way: Big picture style, Big text style or Inbox style.
